virgin fiber cartonboard **made personal**

# Energy Statement

The FOLBB Group is an important player in the European GC2 folding boxboard market and is located in the heart of Europe, right in the middle of its customers with production sites in Eerbeek (NL) and Baiersbronn (GER).

At the FOLBB Group, we pay great attention to producing our products as sustainably as possible.

Both plants are ISO 50001 certified, which means that energy consumption is very well documented and deviations have to be explained.

Moreover, energy savings and related projects form the basis of the certification.

The plants have been reducing their primary fuel consumption for many years. Of course, this is not a new issue for energy-intensive industries like ours! We started energy reduction projects years before the energy crisis. We have also taken measures to ensure that we have sufficient energy available to guarantee our production levels so that we can continue to supply our customers.

Over the past 12 months, several million euros have been invested in both our production sites to reduce energy consumption by 7-10%. We also assess every future investment for its contribution to making our production sites more sustainable.

There are ongoing investigations to further reduce fossil fuel consumption at both sites, for example by realizing a Biomass installation at our Baiersbronn site and heat pump technology at our Eerbeek production site.
